PERFORMANCE AND TECHNOLOGY, SHAPED AROUND YOU

From light to heavy loads, Lincoln incorporates the performance and technology to help you work harder and make playing more fun, too. Crossovers, like the MKT, can tow up to 4,500 lbs. when properly equipped. Navigator lets you enrich your adventures with a best-in-class tow rating of 8,600 lbs.¹ for piloting even the toughest of loads. And available driver-assist towing technologies let you tow your boat, camper or other road-trip essentials with the utmost of ease and confidence.

¹ Navigator RWD models only, when properly equipped. Cargo and load capacity limited by weight distribution.

SAE Towing Standard
The Society of Automotive Engineers (SAE) testing standard J2807 defines procedures and requirements to determine gross combined weight ratings (GCWR) and to calculate the trailer weight rating (TWR) for any tow vehicle. This standard establishes minimum performance conditions to allow for consistent comparisons between similar class vehicles.
The 2019 Navigator shows its spirit with a best-in-class tow rating of 8,600 lbs., making it easy to handle even the toughest towing adventures. The standard trailer tow features provide all that you need to get towing, including a smart trailer tow connector and trailer sway control technologies.

**Notes:**
- Calculated with SAE J2807 method.
- Trailer tongue load weight should be 10% of total loaded trailer weight. Make sure vehicle payload (reduced by option weight) will accommodate trailer tongue load weight and weight of passengers and cargo added to towing vehicle. Additional trailer tongue load weight and weight of passengers and cargo cannot cause vehicle weights to exceed rear GAWR or GVWR. These ratings can be found on the vehicle Safety Compliance Certification Label.

**FRONTAL AREA CONSIDERATIONS**

Frontal Area is the total area in square feet that a moving vehicle and trailer exposes to air resistance. The chart below shows the maximum trailer frontal area that must be considered for a vehicle/trailer combination. Exceeding these limitations may significantly reduce the performance of your towing vehicle.

<table>
<thead>
<tr>

TOWING YOUR LINCOLN VEHICLE BEHIND A MOTORHOME

FOUR-WHEEL-DOWN TOWING

Many motorhome owners prefer the practicality of having another vehicle along when they travel. In fact, towing another vehicle behind the motorhome has become more and more popular in recent years. Furthermore, many of those who want to tow another vehicle prefer one that can be easily towed without a dolly or trailer. For safe operation, towed vehicles (or dollies or trailers carrying them) should be equipped with a separate functional brake system. See last page for additional brake information.

2019 LINCOLN CARS

Automatic Transmission
MKZ Turbocharged 2.0L No
MKZ Twin-Turbocharged 3.0L Yes1,2,3
Continental No

2019 LINCOLN ELECTRIFIED VEHICLES

MKZ Hybrid Yes4,5,6

2019 LINCOLN CUVs/SUVs

MKC No
Nautilus Turbocharged 2.0L No
Nautilus Twin-Turbocharged 2.7L Yes1,2,7,10
MKT Yes1,2,3,6
Navigator/Navigator L 4x2 No
Navigator/Navigator L 4x4 Yes7,8

Note: Some aftermarket camper centers offer kits which may allow vehicles with automatic transmissions to be flat-towed. Check your new vehicle Warranty Guide, as this could void the warranty of your vehicle.

TOW-DOLLY FLEXIBILITY

Tow-dollies allow you to tow your vehicle behind a RV or motorhome if you are unable to four-wheel-down your car, CUV or SUV. Tow-dollies work by elevating the front drive wheels of the vehicle to rest securely on it while the back two wheels stay on the ground. They are not as long as the traditional trailers, which helps make turning corners easy.

Before using the tow-dolly there are a few things you must know before towing. Read the manufacturer’s instructions that came with the tow-dolly before towing, loading or unloading the dolly. Attach the appropriate trailer hitch and drawbar hardware to the vehicle for the tow-dolly. Attach the dolly to the drawbar. The dolly should be completely secure and on level ground before the vehicle to be towed is put on or taken off the dolly. Drive the vehicle onto the dolly with its front wheels. Secure the vehicle to the tow-dolly according to the manufacturer’s instructions. Follow the instructions for attaching and connecting the auxiliary lights to the back of the vehicle being towed. Test the auxiliary lights to make sure that the turn signals, stop lamps, and running lights work properly.

2019 LINCOLN VEHICLES

FWD RWD AWD/4WD
Continental Yes N/A No
MKT Yes N/A No
Nautilus Yes N/A No
MKC Yes N/A No
MKZ Yes N/A No
MKZ Hybrid Yes N/A N/A
Navigator N/A No No

1Intelligent all-wheel-drive (AWD)/4WD vehicles cannot be towed on a dolly.
2Maximum speed with automatic transmission is 65 mph. 3Start the engine and allow it to run for five (5) minutes at the beginning of each day and every six (6) hours thereafter. 4Maximum speed with hybrid transmission is 70 mph. 5Select “Stay In Neutral” mode – refer to owner’s manual transmission and towing sections to follow procedures. 6Start the engine and allow it to run for one (1) minute at the beginning of each day and every six (6) hours thereafter. 7Place the transfer case in the neutral position to engage the four-wheel-down towing feature. See owner’s manual.

Individual vehicles have different restrictions and towing procedures. Contact your dealer for complete details.
KNOW BEFORE YOU TOW

BEFORE YOU BUY
If you are selecting a vehicle that will be used for towing, you should determine the approximate weight of the trailer you intend to tow, including the weight of any additional cargo and fluids that you will be carrying in the trailer. Also, be sure the vehicle has the proper optional equipment (see pages 3–6). Keep in mind that performance can be severely affected in hilly terrain when the minimum acceptable powertrain combination is selected. Consider purchasing a vehicle with a more powerful engine.

AFTER YOU BUY
Before heading out on a trip, check your vehicle’s owner’s manual for break-in and severe-duty maintenance schedules (do not tow a trailer until your vehicle has been driven at least 1,000 miles). Be sure to have your fully-loaded vehicle (including passengers) and trailer weighed so as not to exceed critical weight limits (see page 12). If any of these limits are exceeded, cargo should be removed from the vehicle and/or trailer until all weights are within the specified limits.

BRAKES
Many states require a separate braking system on trailers with a loaded weight of more than 1,500 pounds. For your safety, Ford Motor Company recommends that a separate functional brake system be used on any towed vehicle, including those dolly-towed or towbar-towed. There are several basic types of brake systems designed to activate trailer brakes:

1. Electronically Controlled Brakes usually provide automatic and manual control of trailer brakes. They require that the tow vehicle be equipped with a controlling device and additional wiring for electrical power. These brakes typically have a control box installed within reach of the driver and can be applied manually or automatically.
2. Electric-Over-Hydraulic (EOH) Trailer Brakes are operated by an electrically powered pump that pressurizes a hydraulic fluid reservoir built into the trailer’s brake system. Many of the available EOH trailer brake models are compatible with the Lincoln factory installed, dash-integrated Trailer Brake Controller (TBC).
3. Surge Brakes are independent hydraulic brakes activated by a master cylinder at the junction of the hitch and trailer tongue. They are not controlled by the hydraulic fluid in the tow vehicle’s brake system, and the tow vehicle’s hydraulic system should never be connected directly to the trailer’s hydraulic system.

Be sure your trailer brakes conform to all applicable state regulations. See Safe Towing for All Vehicles on the last page for additional braking information.

TRAILER LAMPS
Make sure the trailer is equipped with lights that conform to all applicable government regulations. The trailer lighting system should not be connected directly to the lighting system of the vehicle. See a local recreational vehicle dealer or rental trailer agency for correct wiring and relays for the trailer and heavy-duty flashers.

SAFETY CHAINS
– Always use safety chains when towing. Safety chains are used to retain connection between the towing and towed vehicle in the event of separation of the trailer coupling or ball
– Cross chains under the trailer tongue to prevent the tongue from contacting the ground if a separation occurs. Allow only enough slack to permit full turning – be sure they do not drag on the pavement
– See your vehicle’s owner’s manual for safety chain attachment information
– For rental trailers, follow rental agency instructions for hookup of safety chains

TRAILER WIRING HARNESS
– Some vehicles equipped with a factory-installed Trailer Tow Package include a trailer wiring harness and a wiring kit
– This kit includes one or more jumper harnesses (to connect to your trailer wiring connector) and installation instructions
### TRAILER CLASSES

</tbody>
</table>

¹Refer to pages 3–6 for required equipment.

### TRAILER TYPES

#### FOLDING CAMPING TRAILER

These are very cost effective units providing campers with a comfortable, dry, mobile shelter, plus these added benefits:
- Lightweight for easy towing
- Simple conventional weight-carrying hitch is usually sufficient for towing
- Compact, low-profile traveling package
- Easily maneuverable – generally 8 to 16 feet long

#### CONVENTIONAL TRAVEL TRAILER

Generally larger, rigid construction units offering more of the conveniences of home, including such features as kitchen sink, dinette, shower, refrigerator and flush toilet. Additional benefits include:
- Widely varied levels of roominess, comfort and luxury – depending on the towing capacity of your vehicle, and your budget
- Sizes usually range from 12 to 35 feet long
- Normally towed with a conventional weight-distributing hitch, depending on weight

### HITCHES

#### WEIGHT-CARRYING (Non-Weight-Distributing)

A weight-carrying (non-weight-distributing) hitch is commonly used to tow small- and medium-sized trailers. Choose a proper hitch and ball, and make sure its location is compatible with that of the trailer. Use a good weight-carrying hitch that uniformly distributes the trailer tongue loads through the bumper and frame (bumper hitch not available with Navigator). Lincoln hitch receivers provide weight-carrying capacities as shown in each chart (see pages 3–6). (A label affixed to the hitch receiver provides both the weight-carrying and weight-distributing capacities for each receiver.) You are responsible for obtaining the proper hitch ball, ball mounting and other appropriate equipment to tow both the trailer and load that will be towed.

#### WEIGHT-DISTRIBUTING

A weight-distributing hitch is used in conjunction with a hitch platform (receiver) to distribute tongue load to all towing vehicle and trailer wheels. Required for certain Class III and all Class IV applications (see each chart on pages 3–6).
- Weight-distributing hitch platforms are welded or bolted to the vehicle frame. Bolt-on types are recommended because they can be removed
- A properly installed bolt-on weight-distributing hitch platform should not weaken the vehicle or underbody as heat of welding might
- Equalizing arms are connected from the hitch to the trailer’s A-frame. They can be adjusted for best towing performance. Lengths of chain are pulled up and tightened to bend spring bars upward, which lifts some of the weight from the rear wheels and transfers weight to the other wheels of the vehicle and trailer
CALCULATING WEIGHT DISTRIBUTION

**WEIGHT DISTRIBUTION HITCH SETUP**

<table>
<thead>
<tr>
<th>Vehicle</th>
<th>Weight Distribution Correction Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continental</td>
<td>Not Required</td>
</tr>
<tr>
<td>MKZ</td>
<td>Not Required</td>

<tr>
<td>MKC</td>
<td>Not Required</td>
</tr>
<tr>
<td>Nautilus</td>
<td>Not Required</td>
</tr>
<tr>
<td>MKT</td>
<td>Not Required</td>
</tr>
<tr>
<td>Navigator</td>
<td>50%</td>
</tr>
</tbody>
</table>

**CALCULATION**

Vehicle =

\[
\begin{align*}
H1 = & \\
H2 = & \\
\text{Correction Factor} = & \\
\text{Height Change} = & (H2) - (H1) \\
\text{Reduction Amount} = & \frac{(\text{Height Change})}{\text{Correction Factor}} \\
\text{Height Change} = & (H2) - \text{Reduction Amount} \\
\text{Target Height} = & \\
\end{align*}
\]

**CALCULATION EXAMPLE**

Vehicle = Navigator

\[
\begin{align*}
H1 = & 37 \text{ inches} \\
H2 = & 38 \text{ inches} \\
\text{Correction Factor} = & 25\% \\
\text{Height Change} = & 38\” - 37\” = 1\” \\
\text{Reduction Amount} = & 1\” \times 25\% = .25 \text{ inches} \\
\text{Height Change} = & 38\” - .25\” = 37.75 \text{ inches} \\
\text{Target Height} = & \\
\end{align*}
\]

1. Load trailer similar to the way it will be loaded for the trip with 10% tongue load and park on level ground
2. Adjust trailer tongue jack to get trailer level or just slightly nose down
3. Load tow vehicle similar to the way it will be used for the trip and park on level ground
4. Adjust and secure weight distribution ball mount height per manufacturer's instructions so tow ball is the same height as trailer coupler when trailer not connected to tow vehicle
5. Measure top of front fender lip above the center of the wheel to ground
6. Record this value as “H1”
7. Connect trailer to tow ball with no weight distribution bars attached (make sure tongue jack is fully retracted)
8. Measure top of front fender lip above the center of the wheel to ground
9. Record this value as “H2”
10. Adjust weight distribution bars per manufacturer’s instructions to get tow vehicle top front of fender lip to “Target Height” and making sure trailer is level to slightly nose down
11. Complete coupler latching, electrical connections, safety chains and emergency braking system attachments
**WHAT’S YOUR WEIGHT?**

**BASE CURB WEIGHT**
Is the weight of the vehicle including a full tank of fuel and all standard equipment. It does not include passengers, cargo or any optional equipment. Your dealership sales consultant can give you this number for the vehicle(s) you are considering.

**CARGO WEIGHT**
Includes all weight added to the Base Curb Weight, including cargo and optional equipment (check with your sales consultant). When towing, trailer tongue load weight is also part of the Cargo Weight.

**PAYLOAD**
is the combined maximum allowable weight of cargo and passengers that the vehicle is designed to carry. It is the Gross Vehicle Weight Rating minus the Base Curb Weight.

**GROSS VEHICLE WEIGHT (GVW)**
is the Base Curb Weight plus actual Cargo Weight plus Passengers. It is important to remember that GVW is not a limit or specification – it is the actual weight that is obtained when the fully-loaded vehicle is driven onto a scale.

**GROSS VEHICLE WEIGHT RATING (GVWR)**
is the maximum allowable weight of the fully-loaded vehicle (including passengers and cargo). This number – along with other weight limits, as well as tire, rim size and inflation pressure data – is shown on the vehicle’s Safety Compliance Certification Label, located on the left front door lock facing or the door latch post pillar (see next page). The GVW must never exceed the GVWR.

**GROSS AXLE WEIGHT (GAW)**
is the total weight placed on each axle (front and rear). To determine the Gross Axle Weights for your vehicle and trailer combination, take your loaded vehicle and trailer to a scale. With the trailer attached, place the front wheels of the vehicle on the scale to get the front GAW. For rear GAW, weigh the towing vehicle with trailer attached, but with just the four wheels of the vehicle on the scale. Subtracting front GAW from that amount gives you rear GAW.

**GROSS AXLE WEIGHT RATING (GAWR)**
is the maximum weight to be carried by a single axle (front or rear). These numbers are also shown on the Safety Compliance Certification Label. The total load on each axle must never exceed its GAWR.

---

**MEASURING TONGUE LOAD WITH COMMERCIAL SCALE**
To measure actual tongue load weight, disconnect the trailer and place only the tongue on a scale (at hitch ball receiver height). If the tongue load weight exceeds the upper weight limit, move more of the trailer contents rearward to achieve the recommended tongue load weight. If the tongue load weight is less than the lower limit, shift the load forward.
**Gross Combination Weight (GCW)**
is the weight of the loaded vehicle (GVW) plus the weight of the fully loaded trailer. It is the actual weight obtained when the vehicle and trailer are weighed together on a scale.

**Gross Combination Weight Rating (GCWR)**
is the maximum allowable weight of the towing vehicle and the loaded trailer — including all cargo and passengers — that the vehicle can handle without risking damage. (Important: The towing vehicle’s brake system is rated for operation at the GVWR – NOT GCWR. Separate functional brake systems should be used for safe control of towed vehicles and for trailers weighing more than 1,500 lbs. when loaded.) The measured GCW must never exceed the GCWR.

**Maximum Loaded Trailer Weight**
as shown in the Trailer Towing Selector charts pages 3–7) is the highest possible weight of a fully loaded trailer the vehicle can tow, based on a minimum towing vehicle GVW. It assumes a towing vehicle with any mandatory options, no cargo, tongue load of 10% weight, and driver and passenger (150 lbs. each). Weight of additional options, passengers, cargo and hitch must be deducted from this weight.

**Tongue Load Weight**
is another critical measurement that must be made before towing. It refers to the amount of the trailer’s weight that presses down on the trailer hitch. Too much tongue load weight can cause suspension/drivetrain damage, and can press the vehicle down in back causing the front wheels to lift to the point where traction, steering response and braking can be severely decreased. Too little tongue load weight can reduce rear-wheel traction and cause instability, which may result in tail wagging or jackknifing.

Tongue load weights must meet the following requirements:*
– For trailers up to 2,000 lbs., tongue load not to exceed 200 lbs.
– For conventional trailers over 2,000 lbs., tongue load 10% of loaded trailer weight

**Examples:** For a 5,000-lb. conventional trailer, multiply 5,000 by .10 to obtain a proper tongue load of 500 lbs.

**Note:** Be sure the addition of tongue load weight does not cause the key towing vehicle weight limits (GVWR and Rear GAWR) to be exceeded. Remember, GVWR and GAWR are found on the vehicle’s Safety Compliance Certification Label. If either of these limits is exceeded, you should go with a larger vehicle or a smaller trailer.

*Refer to the charts on vehicle pages 3–6 for tongue load recommendations with Lincoln factory-installed trailer hitch receivers.
SAFE TOWING FOR ALL VEHICLES

Towing a trailer is demanding on your vehicle, your trailer and your personal driving skills.

Follow some basic rules that will help you tow safely and have a lot more fun.

WEIGHT DISTRIBUTION
– For optimum handling and braking, the load must be properly distributed
– Keep center of gravity low for best handling
– Approximately 60% of the allowable cargo weight should be in the front half of the trailer and 40% in the rear (within limits of tongue load weight)
– Load should be balanced from side-to-side to optimize handling and tire wear
– Load must be firmly secured to prevent shifting during cornering or braking, which could result in a sudden loss of control

BEFORE STARTING
– Before setting out on a trip, practice turning, stopping and backing up your trailer in an area away from heavy traffic
– Know clearance required for trailer roof
– Check equipment (make a checklist)

BACKING UP
– Back up slowly, with someone spotting near the rear of the trailer to guide you
– Place one hand at bottom of steering wheel and move it in the direction you want the trailer to go
– Make small steering inputs—slight movement of steering wheel results in much greater movement in rear of trailer

TURNING
When turning, be sure to swing wide enough to allow trailer to avoid curbs and other obstructions.

BRAKING
– Allow considerably more distance for stopping with trailer attached
– Remember, the braking system of the tow vehicle is rated for operation at the GVWR, not GCWR
– If your tow vehicle is a Navigator and your trailer has electric brakes, the optional Integrated Trailer Brake Controller (TBC) assists in smooth and effective trailer braking by powering the trailer’s electric or electric-over-hydraulic brakes with proportional output based on the towing vehicle’s brake pressure
– If you are experiencing trailer sway and your vehicle is equipped with electric brakes and a brake controller, activate the trailer brakes with the brake controller by hand. Do not apply the tow vehicle brakes as this can result in increased sway

TOWING ON HILLS
Downshift the transmission to assist braking on steep downgrades and to increase power (reduce lugging) when climbing hills

PARKING WITH A TRAILER
Whenever possible, vehicles with trailers should not be parked on a grade. However, if it is necessary, place wheel chocks under the trailer’s wheels, following the instructions below.
– Apply the foot service brakes and hold
– Have another person place the wheel chocks under the trailer wheels on the downgrade side
– Once the chocks are in place, release brake pedal, making sure the chocks will hold the vehicle and trailer
– Apply the parking brake
– Shift automatic transmission into park
– With 4-wheel drive, make sure the transfer case is not in neutral (if applicable)

STARTING OUT PARKED ON A GRADE
– Apply the foot service brake and hold
– Start the engine with transmission in park
– Shift the transmission into gear and release the parking brake
– Release the brake pedal and move the vehicle uphill to free the chocks
– Apply the brake pedal while another person retrieves the chocks

ACCELERATION AND PASSING
The added weight of the trailer can dramatically decrease the acceleration of the towing vehicle—exercise caution.
– When passing a slower vehicle, be sure to allow extra distance. Remember, the added length of the trailer must clear the other vehicle before you can pull back in
– Signal and make your pass on level terrain with plenty of clearance
– If necessary, downshift for improved acceleration

DRIVING WITH AN AUTOMATIC OVERDRIVE TRANSMISSION
With certain automatic overdrive transmissions, towing—especially in hilly areas—may cause excessive shifting between overdrive and the next lower gear.
– To eliminate this condition and achieve steadier performance, overdrive can be locked out (see vehicle owner’s manual)
– If excessive shifting does not occur, use overdrive to optimize fuel economy
– Overdrive may also be locked out to obtain engine braking on downgrades
– When available, select tow/haul mode to automatically eliminate unwanted gear search and help control vehicle speed when going downhill

DRIVING WITH CRUISE CONTROL
Turn off the cruise control with heavy loads or in hilly terrain. The cruise control may turn off automatically when you are towing on long, steep grades. Use caution while driving on wet roads and avoid using cruise control in rainy or winter weather conditions.

TIRE PRESSURE
– Underinflated tires get hot and may fail, leading to possible loss of vehicle control
– Overinflated tires may wear unevenly and compromise traction and stopping capability
– Tires should be checked often for conformance to recommended cold inflation pressures

SPARE TIRE USE
A conventional, identical full-size spare tire is required for trailer towing (mini, compact and dissimilar full-size spare tires should not be used; always replace the spare tire with a new road tire as soon as possible).

ON THE ROAD
After about 50 miles, stop in a protected location and double-check:
– Trailer hitch attachment
– Lights and electrical connections
– Trailer wheel lug nuts for tightness
– Engine oil—check regularly throughout trip

HIGH ALTITUDE OPERATION
Gasoline engines lose power by 3-4% per 1,000 ft. elevation. To maintain performance, reduce GVWs and GCWs by 2% per 1,000 ft. elevation starting at the 1,000 ft. elevation point.

POWERTRAIN.FRONTAL AREA
CONSIDERATIONS
The charts in this Guide show the minimum engine size needed to move the GCW of tow vehicle and trailer.
– Under certain conditions, however, (e.g., when the trailer has a large frontal area that adds substantial air drag or when trailerling in hilly or mountainous terrain) it is wise to choose a larger engine
– Selecting a trailer with a low-drag, rounded front design will help optimize performance and fuel economy

Note: For additional trailering information pertaining to your vehicle, refer to the vehicle owner’s manual.
